

ProjectGenAI: Multi-Agent Intelligent Project Proposal Generation System Using n8n

PROBLEM STATEMENT:

Students and researchers often spend significant time preparing project proposals, identifying suitable technologies, defining objectives, designing system architectures, and creating documentation. This process requires extensive research and planning, which can delay project initiation and reduce productivity. Many students also struggle to transform an initial idea into a well-structured project plan. To address this challenge, the proposed system utilizes multiple AI agents that collaborate to analyze project ideas, perform research, generate system architectures, and automatically create project documentation. The solution aims to simplify the project planning process, improve efficiency, and provide users with comprehensive project proposals in a short period of time.

OBJECTIVE:

1. To develop a multi-agent AI system that can automatically analyze user-provided project ideas.
2. To generate detailed project proposals including problem statements, objectives, methodology, and future scope.
3. To assist users in identifying appropriate technologies, tools, and implementation strategies for their projects.
4. To automate project research and provide relevant insights for better decision-making.
5. To generate system architecture and module descriptions based on project requirements.
6. To reduce the time and effort required for project planning and documentation.
7. To provide a user-friendly platform that helps students and researchers quickly transform ideas into structured project proposals.
