

Title: CrimeVision AI

Problem Statement

Crime scene investigation involves analyzing images collected from incident locations to identify suspicious objects, possible evidence, and important forensic clues. Manual examination of crime scene images is time-consuming and critical details may sometimes be overlooked. There is a need for an intelligent system that can assist investigators by automatically analyzing crime scene images and generating useful forensic observations.

CrimeVision AI is an AI-powered forensic assistance system that uses Machine Learning and Computer Vision techniques to detect suspicious objects, analyze scene conditions, identify possible suspicious individuals, and generate preliminary crime scene observations from uploaded images. The system aims to support investigators by improving investigation efficiency and reducing manual analysis effort.

Objectives

- To develop an AI-based system for crime scene image analysis.
- To detect suspicious objects and important evidence automatically.
- To identify and highlight suspicious regions in crime scene images.
- To generate scene descriptions and forensic observations using AI.
- To identify possible suspicious individuals based on scene analysis.
- To assist investigators in reducing manual investigation time using Machine Learning and Computer Vision techniques.
